

IN THE CLAIMS

Please amend claims 3, 7, 10 and 11 as follows:

1 1. (Original) A method for batch registration of an integrated digital loop carrier
2 (IDLC) subscriber using program loaded data (PLD) of an exchange, comprising:

3 (a) opening a program loaded data (PLD) file of an exchange selected by a client
4 terminal accessing through a network, and listing and displaying, on a graphical user
5 interface of the client terminal, information relative to subscribers included in the
6 program loaded data (PLD) file;

7 (b) displaying, on the graphical user interface of the client terminal, shelf
8 information of an integrated digital loop carrier (IDLC) network element which will
9 accept the subscribers included in the program loaded data (PLD) file;

10 (c) receiving a shelf range in the displayed network element, and displaying the
11 shelf range on the graphical user interface of the client terminal when a mode for
12 designing subscriber constitution by shelves is selected;

13 (d) receiving a list of a range of the subscribers who will be accepted in the shelf
14 within a designated range of the subscribers, and displaying the list on the graphical user
15 interface of the client terminal; and

16 (e) transmitting a command for registering the subscribers within the designated
17 range in the shelf within the designated range, performing batch registration of a
18 subscriber for a corresponding shelf, receiving verification information for registration of

19 the subscriber from the corresponding shelf, and displaying a result on the graphical user
20 interface of the client terminal.

1 2. (Original) The method of claim 1, wherein step (a) comprises the steps of:
2 opening the program loaded data (PLD) file of the exchange, and storing the
3 subscriber data in a memory in the form of a table;
4 displaying the subscriber data stored in the table in a first area of the graphical
5 user interface of the client terminal; and
6 extracting and displaying, in a second area of the graphical user interface of the
7 client terminal, V5IDs and L3 addresses of each subscriber from the subscriber data
8 stored in the table.

1 3. (Currently Amended) The method of claim 2, wherein the table comprises
2 subscriber information to enable an operator to search each subscriber data, confirm
3 whether subscribers are public switched telephone network (PSTN) subscribers or
4 general telephone subscribers, and display a result so as to register the subscribers in the
5 corresponding shelf.

1 4. (Original) The method of claim 1, wherein step (b) comprises displaying a list
2 of shelves of the element, a number of slots in a subscriber line unit set up in each shelf,
3 and a total number of available ports.

1 5. (Original) A recording medium which is executed by a computer device, and
2 which includes an electromagnetically-stored program for performing a method for batch
3 registration of an integrated digital loop carrier (IDLC) subscriber using a program
4 loaded data (PLD) of an exchange, said method comprising:

5 (a) opening a program loaded data (PLD) file of an exchange selected by a client
6 terminal accessing through a network, and listing and displaying, on a graphical user
7 interface of the client terminal, information relative to subscribers included in the
8 program loaded data (PLD) file;

9 (b) displaying, on the graphical user interface of the client terminal, shelf
10 information of an integrated digital loop carrier (IDLC) network element which will
11 accept the subscribers included in the program loaded data (PLD) file;

12 (c) receiving a shelf range in the displayed network element, and displaying the
13 shelf range on the graphical user interface of the client terminal when a mode for
14 designing subscriber constitution by shelves is selected;

15 (d) receiving a list of a range of the subscribers who will be accepted in the shelf
16 within a designated range of the subscribers, and displaying the list on the graphical user
17 interface of the client terminal; and

18 (e) transmitting a command for registering the subscribers within the designated
19 range in the shelf within the designated range, performing batch registration of a
20 subscriber for a corresponding shelf, receiving verification information for registration of

21 the subscriber from the corresponding shelf, and displaying a result on the graphical user
22 interface of the client terminal.

1 6. (Original) The recording medium of claim 5, wherein step (a) comprises the
2 steps of:

3 opening the program loaded data (PLD) file of the exchange, and storing the
4 subscriber data in a memory in the form of a table;

5 displaying the subscriber data stored in the table in a first area of the graphical
6 user interface of the client terminal; and

7 extracting and displaying, in a second area of the graphical user interface of the
8 client terminal, V5IDs and L3 addresses of each subscriber from the subscriber data
9 stored in the table.

1 7. (Currently Amended) The recording medium of claim 6, wherein the table
2 comprises subscriber information to enable an operator to search each subscriber data,
3 confirm whether subscribers are public switched telephone network (PSTN) subscribers
4 or general telephone subscribers, and display a result so as to register the subscribers in
5 the corresponding shelf.

1 8. (Original) The recording medium of claim 5, wherein step (b) comprises
2 displaying a list of shelves of the element, a number of slots in a subscriber line unit set

up in each shelf, and a total number of available ports.

9. (Original) An element management system server, comprising:

storing and display means for storing at least one exchange program loaded data (PLD), for opening a program loaded data (PLD) file of an exchange selected by a client terminal linked to the server through a network, and for listing and displaying, on a graphical user interface of the client terminal, information relative to subscribers included in the program loaded data (PLD) file according to input information from the client terminal;

display means for displaying, on the graphical user interface of the client terminal, shelf information of an integrated digital loop carrier (IDLC) network element which will accept the subscribers included in the program loaded data (PLD) file;

receiving and displaying means for receiving a shelf range in the displayed network element, and for displaying the shelf range on the graphical user interface of the client terminal when a mode for designing subscriber constitution by shelves is selected;

additional receiving and displaying means for receiving a list of a range of the subscribers who will be accepted in the shelf within a designated range of the listed subscribers, and for displaying the list on the graphical user interface of the client terminal; and

transmitting means for transmitting a command for registering the subscribers within the designated range in the shelf within the designated range, for performing batch

20 registration of a subscriber for a corresponding shelf, for receiving verification
21 information for registration of the subscriber from the corresponding shelf, and for
22 displaying a result on the graphical user interface of the client terminal.

1 10. (Currently Amended) The element management system server of claim
2 [[1]]2, wherein the storing and display means opens the program loaded data (PLD) file
3 of the exchange, stores the subscriber data in a memory in the form of a table, displays
4 the subscriber data stored in the table in a first area of the graphical user interface of the
5 client terminal, and extracts and displays, in a second area of the graphical user interface
6 of the client terminal, VSIDs and L3 addresses of each subscriber from the subscriber
7 data stored in the table.

1 11. (Currently Amended) The element management system server of claim 10,
2 wherein the table comprises subscriber information to enable an operator to search each
3 subscriber data, confirm whether subscribers are public switched telephone network
4 (PSTN) subscribers or general telephone subscribers, and display a result so as to register
5 the subscribers in the corresponding shelf.

1 12. (Original) The element management system server of claim 9, wherein the
2 display means displays a list of shelves of the element, a number of slots in a subscriber
3 line unit set up in each shelf, and a total number of available ports.
